RESOURCE SHARING

©*Giovanni De Micheli*

Stanford University

Outline

- Resource-dominated circuits.
  - Flat and hierarchical graphs.
  - Functional and memory resources.
- Extensions.
  - Non resource-dominated circuits.
  - Concurrent scheduling and binding.
  - Module selection.

Allocation and binding

- *Allocation:*
  - Number of resources available.
- *Binding:*
  - Relation between operations and resources.
- *Sharing:*
  - Many-to-one relation.
- *Optimum binding/sharing:*
  - Minimize the resource usage.

Binding

- Limiting cases:
  - Dedicated resources:
    - One resource per operation.
    - No sharing.
  - One multi-task resource:
    - ALU.
  - One resource per type.

Optimum sharing problem

© GDM

- Scheduled sequencing graphs.
  - Operation concurrency well defined.
- Consider *operation types* independently.
  - Problem decomposition.
  - Perform analysis for each resource type.

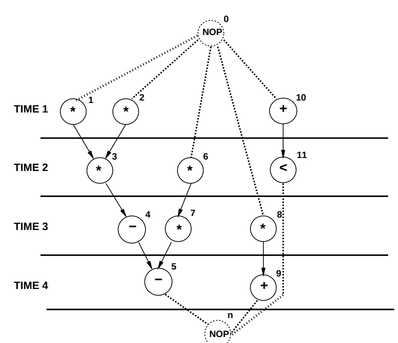
Compatibility and conflicts

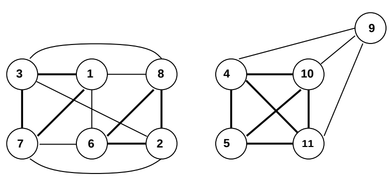
© GDM

- Operation compatibility:
  - Same type.
  - Non concurrent.
- *Compatibility* graph:
  - Vertices: operations.
  - Edges: compatibility relation.
- *Conflict* graph:
  - Complement of compatibility graph.

Example

© GDM





- Multiplier ALU

Algorithmic solution to the optimum binding problem

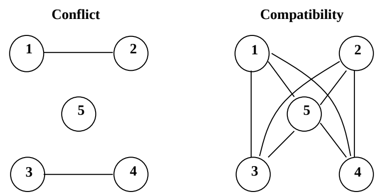
© GDM

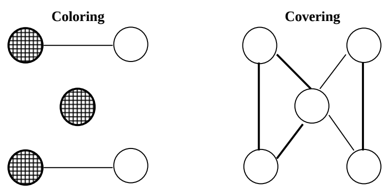
- *Compatibility* graph.
  - Partition the graph into a minimum number of cliques.
  - Find *clique cover number* $\kappa(G_+)$.
- *Conflict* graph.
  - Color the vertices by a minimum number of colors.
  - Find *chromatic number* $\chi(G_-)$.
- NP-complete problems – Heuristic algorithms.

Example

© GDM

t1	x=a+b	y=c+d	1	2
t2	s=x+y	t=x−y	3	4
t3	z=a+t		5	





ALU1: 1,3,5
ALU2: 2,4

Perfect graphs

© GDM

- *Comparability graph*:
  - Graph $G(V, E)$ has an orientation $G(V, F)$ with the transitive property.
  - $(v_i, v_j) \in F \cup (v_j, v_k) \in F \Rightarrow (v_i, v_k) \in F$.
- *Interval graph:*
  - Vertices correspond to *intervals*.
  - Edges correspond to interval intersection.
  - Subset of *chordal* graphs:
    - ∗ Every loop with more than three edges has a chord.

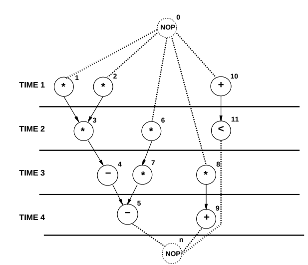
Data-flow graphs (flat sequencing graphs)

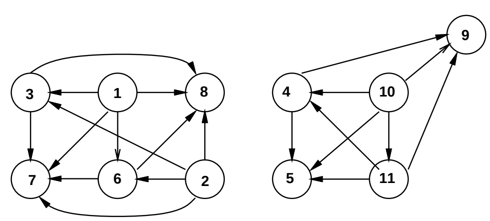
© GDM

- The compatibility/conflict graphs have special properties.
  - Compatibility:
    - ∗ Comparability graph.
  - Conflict:
    - ∗ Interval graph.
- Polynomial time solutions:
  - Golumbic's algorithm.
  - Left-edge algorithm.

Example

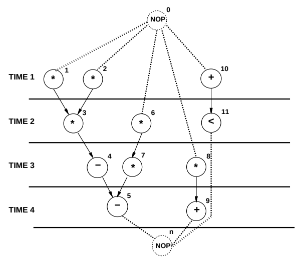
© GDM

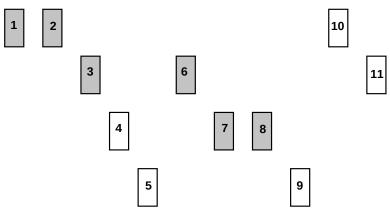




Example

© GDM





Left-edge algorithm

© GDM

- Input:
  - Set of intervals with $left$ and $right$ edge.
- Rationale:
  - Sort intervals by $left$ edge.
  - Assign non overlapping intervals to first color using the sorted list.
  - When possible intervals are exhausted increase color counter and repeat.

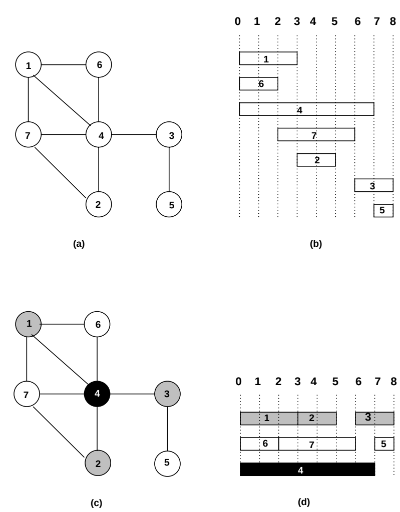
Left-edge algorithm

© GDM

$LEFT\_EDGE(I)$ {
  Sort elements of I in a list L in ascending order of l_i;
  $c = 0$;
  while (some interval has not been colored) **do** {
    $S = \emptyset$;
    $r = 0$;
    while ($\exists s \in L$ such that $l_s > r$) **do**{
      $s =$ First element in the list L with $l_s > r$;
      $S = S \cup \{s\}$;
      $r = r_s$;
      Delete s from L;
    }
    $c = c + 1$;
    Label elements of S with color c;
  }
}

Example

© GDM



ILP formulation of binding

- Boolean variables b_{ir}
  - Operation i bound to resource r.
- Boolean variables x_{il}
  - Operation i scheduled to start at step l.

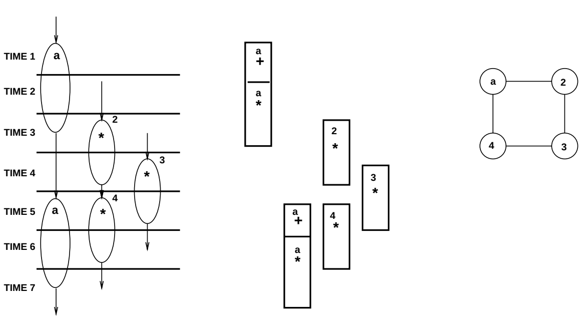
$$\sum_{r=1}^{a} b_{ir} = 1 \quad \forall i$$

$$\sum_{i=1}^{n_{ops}} b_{ir} \sum_{m=l-d_i+1}^{l} x_{im} \leq 1 \quad \forall l \ \forall r$$

Hierarchical sequencing graphs

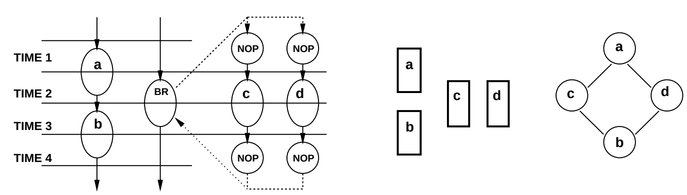
- Hierarchical conflict/compatibility graphs.
  - Easy to compute.
  - Prevent sharing across hierarchy.
- Flatten hierarchy.
  - Bigger graphs.
  - Destroy nice properties.

Example



(a) (b) (c)

Example



(a) (b) (c)

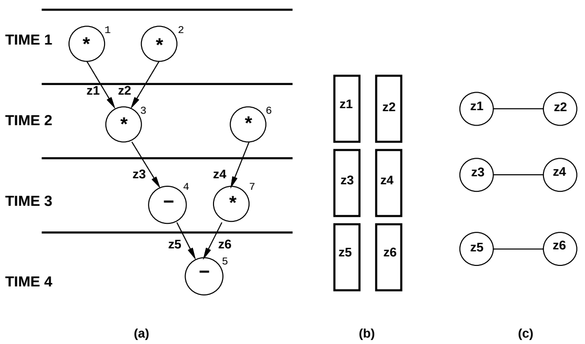
Register binding problem

- Given a schedule:
  - *Lifetime intervals* for variables.
  - *Lifetime overlaps*.
- Conflict graph (*interval graph*).
  - Vertices ↔ variables.
  - Edges ↔ overlaps.
  - Interval graph.
- Compatibility graph (*comparability graph*).
  - Complement of conflict graph.

Register sharing data-flow graphs

- Given:
  - Variable lifetime conflict graph.
- Find:
  - Minimum number of registers storing all the variables.
- Key point:
  - Interval graph:
    - Left-edge algorithm. (Polynomial-time).

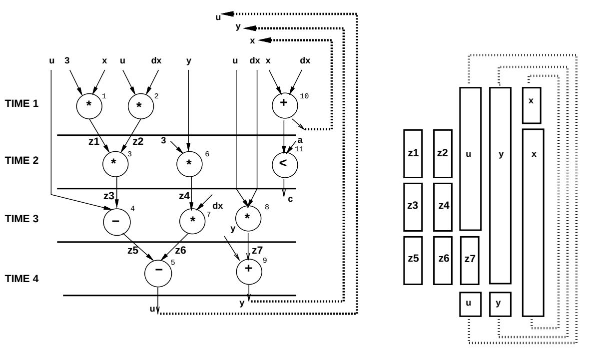
Example



Register sharing general case

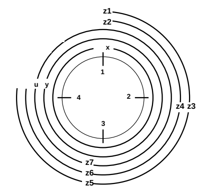
- Iterative constructs:
  - Preserve values across iterations.
  - *Circular-arc* conflict graph:
    - Coloring is intractable.
- Hierarchical graphs:
  - General conflict graphs:
    - Coloring is intractable.
- Heuristic algorithms.

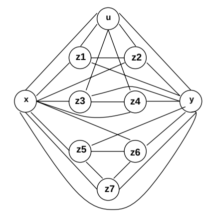
Example



(a) (b)

Example Variable-lifetimes and circular-arc conflict graph





Multiport-memory binding

- Find *minimum number of ports* to access the required number of variables.
- Variables use the same port:
  - Port compatibility/conflict.
  - Similar to resource binding.
- Variables can use any port:
  - Decision variable x_{il} is TRUE when variable i is accessed at step l.
  - Optimum: $\max_{1 \le l \le \lambda+1} \sum_{i=1}^{n_{var}} x_{il}$.

Multiport-memory binding

- Find *maximum number of variables* to be stored through a fixed number of ports a.
  - Boolean variables $\{b_i, i = 1, 2, \ldots, n_{var}\}$:
    - ∗ Variable i is stored in array.
  - max $\sum_{i=1}^{n_{var}} b_i$ such that
  - $\sum_{i=1}^{n_{var}} b_i \; x_{il} \le a \qquad l = 1, 2, \ldots, \lambda + 1$

Example formulation

$$
\begin{array}{lcl}
Time-step\ 1 & : & r_3 = r_1 + r_2\ ;\ r_{12} = r_1 \\
Time-step\ 2 & : & r_5 = r_3 + r_4\ ;\ r_7 = r_3 * r_6\ ;\ r_{13} = r_3 \\
Time-step\ 3 & : & r_8 = r_3 + r_5\ ;\ r_9 = r_1 + r_7\ ;\ r_{11} = r_{10}/r_5 \\
Time-step\ 4 & : & r_{14} = r_{11} \wedge r_8\ ;\ r_{15} = r_{12} \vee r_9 \\
Time-step\ 5 & : & r_1 = r_{14}\ ;\ r_2 = r_{15}
\end{array}
$$

$\max \sum_{i=1}^{15} b_i$ such that

$$
\begin{array}{rcl}
b_1 + b_2 + b_3 + b_{12} & \leq & a \\
b_3 + b_4 + b_5 + b_6 + b_7 + b_{13} & \leq & a \\
b_1 + b_3 + b_5 + b_7 + b_8 + b_9 + b_{10} + b_{11} & \leq & a \\
b_8 + b_9 + b_{11} + b_{12} + b_{14} + b_{15} & \leq & a \\
b_1 + b_2 + b_{14} + b_{15} & \leq & a
\end{array}
$$

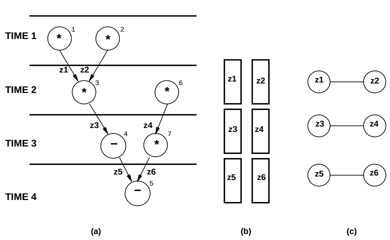
Example solution

- One port $a = 1$:
  - $\{b_2, b_4, b_8\}$ non-zero.
  - 3 variables stored: v_2, v_4, v_8.
- Two ports $a = 2$:
  - 6 variables stored: $v_2, v_4, v_5, v_{10}, v_{12}, v_{14}$
- Three ports $a = 3$:
  - 9 variables stored: $v_1, v_2, v_4, v_6, v_8, v_{10}, v_{12}, v_{13}$

Bus sharing and binding

- Find the *minimum number of busses* to accommodate all data transfer.
- Find the *maximum number of data transfers* for a fixed number of busses.
- Similar to memory binding problem.
- ILP formulation or heuristic algorithms.

Example



- One bus:
  - 3 variables can be transferred.
- Two busses:
  - All variables can be transferred.

Scheduling and binding Resource dominated circuits

- Area and delay of resources dominate.
- Strategy:
  - Scheduling under area constraints:
    - Minimize latency.
  - Binding.
    - Share resource within bounds.
- Decoupling between scheduling and binding.

Scheduling and binding General circuits

- Area and delay influenced by:
  - *Sparse logic, wiring, registers* and *control circuit*.
- Binding affects the *cycle-time*:
  - It may invalidate a schedule.
- Scheduling after binding:
  - Binding under restrictive assumptions.
  - Time-frame of operations not yet known.

Scheduling and binding approaches

- *Concurrent* scheduling and binding.
  - ILP model- exact.
  - Some heuristic algorithms.
- *Scheduling before binding:*
  - Good for DSP application.
- *Binding before scheduling:*
- *Iterative* techniques.

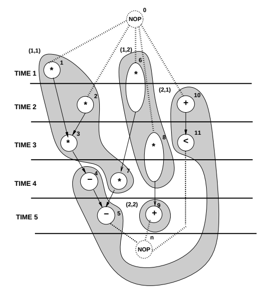
Module selection problem

- Library of resources:
  - More than one resource per type.
- Example:
  - Ripple-carry adder.
  - Carry look-ahead adder.
- Resource modeling:
  - Resource *subtypes* with:
    - *(area, delay)* parameters.

Module selection solution

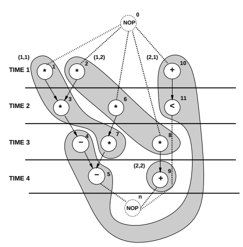
- ILP formulation:
  - Decision variables:
    - Select resource sub-type.
    - Determine *(area, delay)*.
- Heuristic algorithms:
  - Determine *minimum latency* with fastest resource subtypes.
  - Recover area by using slower resources on non-critical paths.

Example



- Multipliers with:
  - (Area, delay) = (5,1) and (2,2)
- Latency bound of 5.

Example (2)



- Latency bound of 4.
  - Fast multipliers for $\{v_1, v_2, v_3\}$.
  - Slower multipliers can be used elsewhere.
    - Less sharing.
- Minimum-area design uses fast multipliers only.

Summary

- Resource sharing is reducible to coloring/clique-covering.
- Simple for flat graphs.
- Intractable, but still easy in practice, for other graphs.
- More complicated for non resource-dominated circuits.
- Extension: module selection.
