

NetChip: A Design Flow for Networks on Chips

Stergios Stergiou

Stanford University, CA, USA

Outline

- **Motivation**
- **xpipes Lite Library Architecture**
- **NetChip Design Flow**
- **Experimental Results**

Introduction

xpipes Lite Architecture
Design Flow
Experimental Results

Motivation

Traditional Bus Architectures
NoCs

Motivation

- **Design Complexity:**
 - From 10 to 100+ Cores!
- **Performance:**
 - Requirements Go Up!
 - Power Budget Remains Fixed
- **Scalability:**
 - Current Architectures Cannot Keep Up!

Introduction
 xpipes Lite Architecture
 Design Flow
 Experimental Results

Motivation
 Traditional Bus Architectures
 NoCs

Bus Architectures

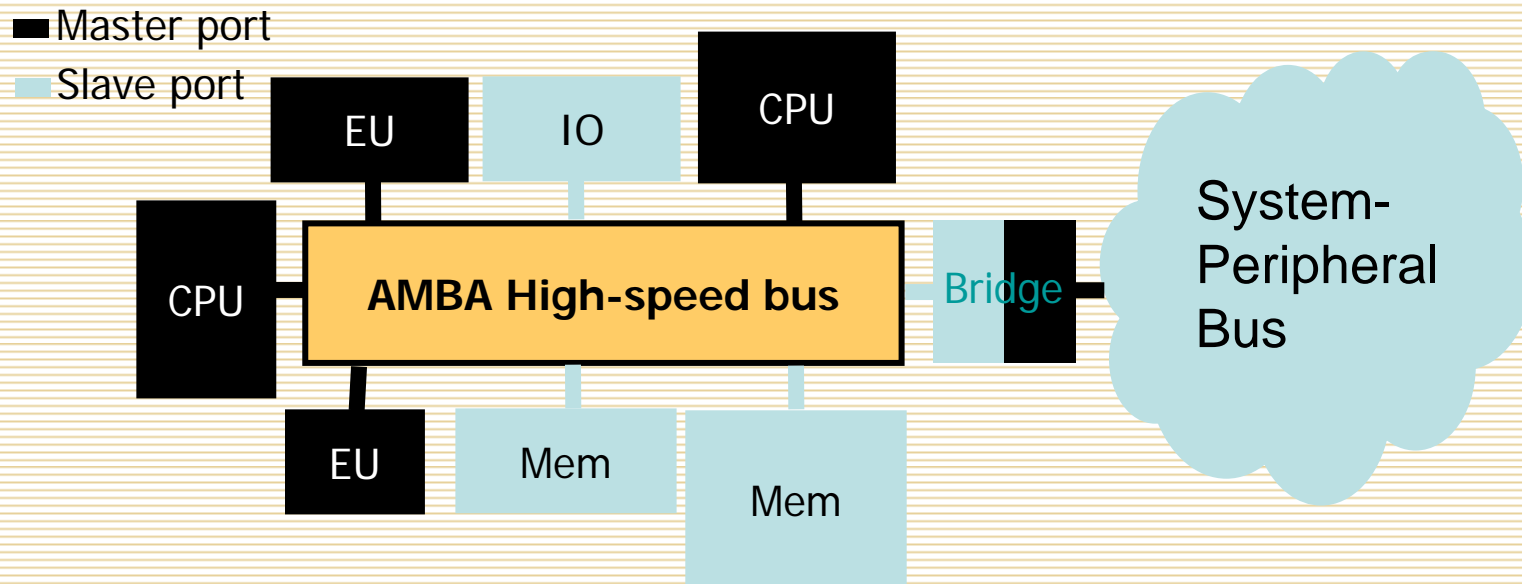

● Sonics MicroNetwork

- Highly Parameterizable, TDMA-based Bus

● STBus / AMBA

- High Performance, Support Instantiation of Various Topologies

Example: AMBA

Bus Architectures

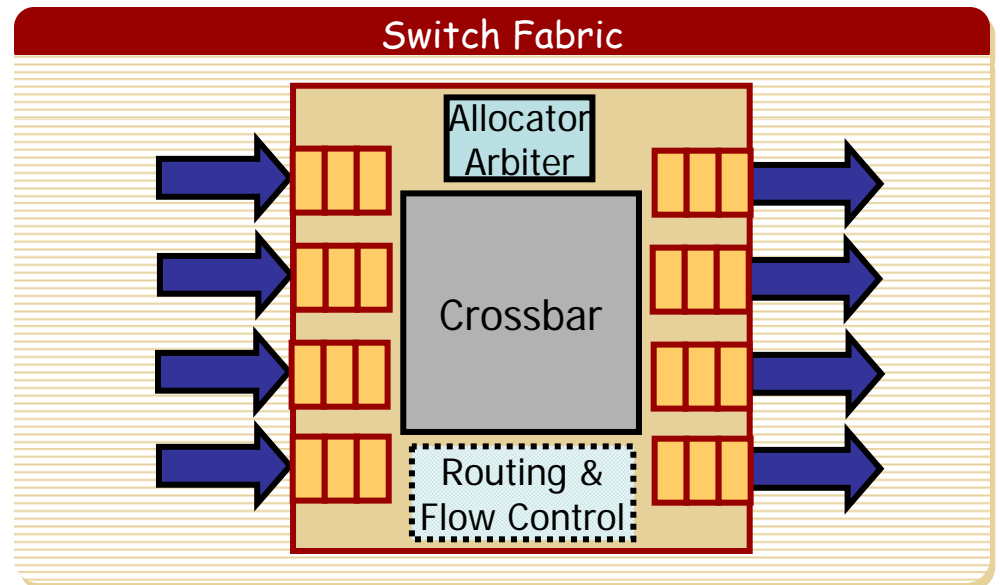

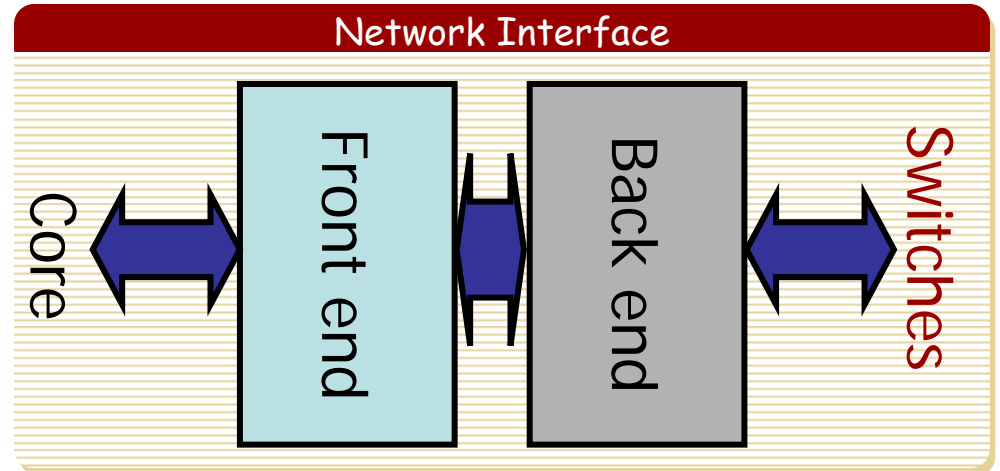

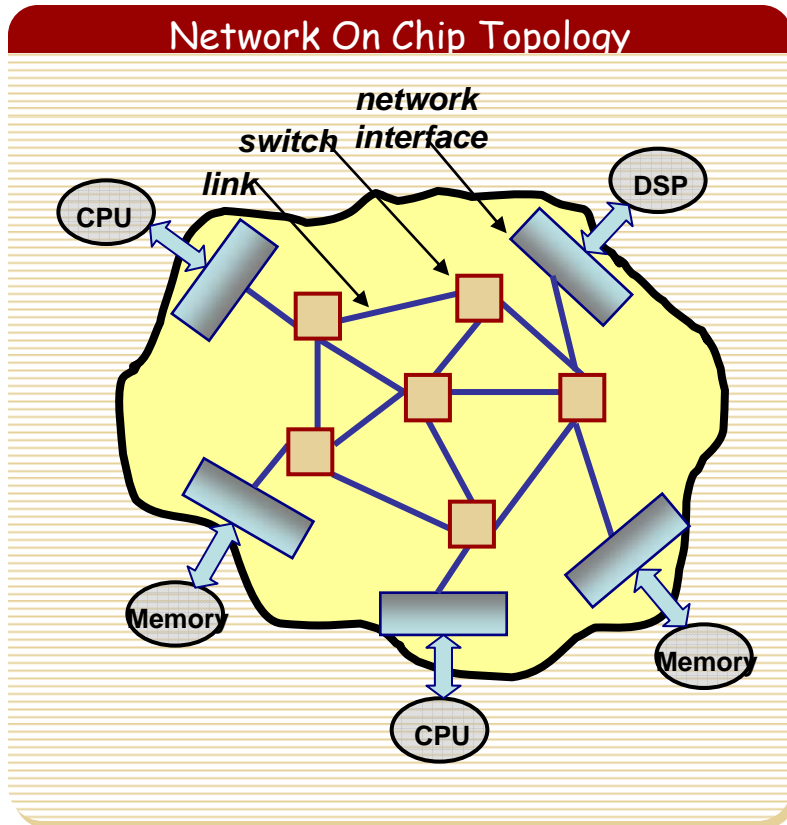

- Protocol
 - Lacks parallelism
 - *Traditionally:*
 - in order completion
 - no multiple outstanding transactions
- High arbitration overhead
- Bus architecture exposed
 - Hinders IP integration
- Topology
 - Scalability limitation of shared bus solution

Introduction
xpipes Lite Architecture
Design Flow
Experimental Results

Motivation
Traditional Bus Architectures
NoCs

Networks on Chips

Introduction

xpipes Lite Architecture
Design Flow
Experimental Results

Motivation

Traditional Bus Architectures

NoCs

Networks on Chips

Previous Work

• NoC Architectures

• SPIN, *DATE'00*

• Dally & Towles, *DAC'01*

• Aethereal, *DATE'03*

• xpipes, *ICCD'03*

• Design Tools

• Power Analysis: T. Ye et al, *DAC'02*

• xpipes Compiler: A. Jalabert et al, *DATE'04*

• Industry

• Arteris, STmicroelectronics

Introduction	Lite Version
xpipes Lite Architecture	NI Architecture
Design Flow	Packetization
Experimental Results	Switch Architecture

Xpipes Lite: Redesign

Xpipes Lite

- Second xpipes Design Library Version
- *Complete Redesign!*
- Goals:
 - High Performance
 - Automated Synthesis
- Comparison With Original xpipes Library
 - Lower Latency (7 to 2 stage switches)
 - Fully Synthesizable!

Introduction	Lite Version
xpipes Lite Architecture	NI Architecture
Design Flow	Packetization
Experimental Results	Switch Architecture

Xpipes Lite: Network Interface

OCP

- End-to-end communication protocol
- Independent request/response
- Can be tailored to core features
- Support for sideband signals
 - interrupts
- Efficient burst handling
- Supports threading extensions

Network Interface

Transaction centric

Network protocol

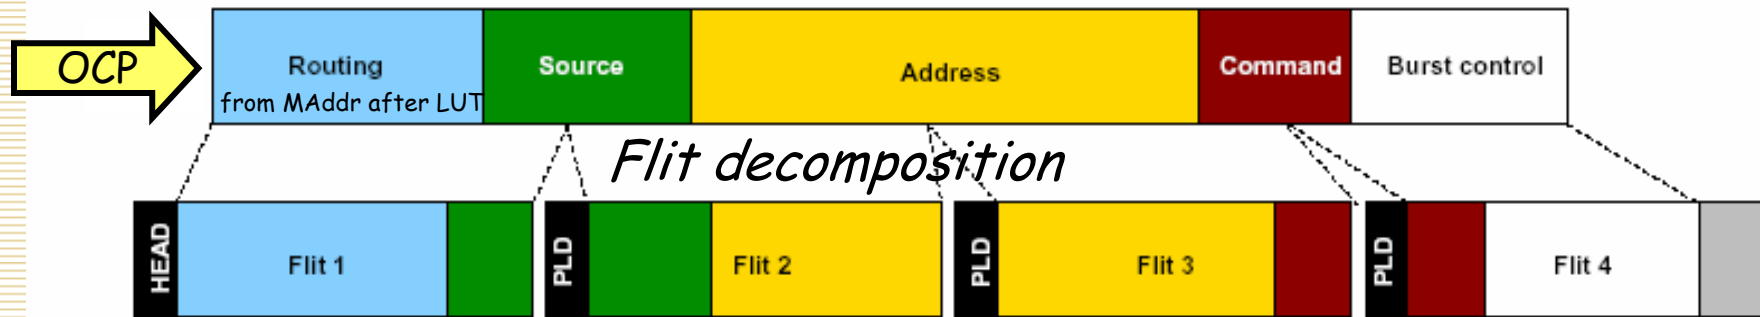

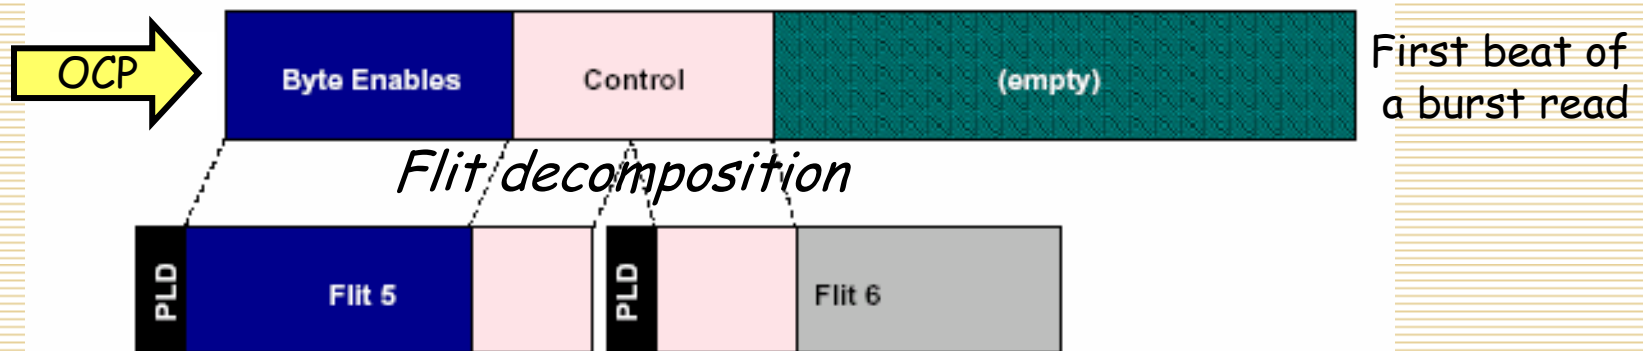

Xpipes Lite: Packetization

Packetization

Header register (about 50 bits): one for every transaction

Payload register: one for every burst beat

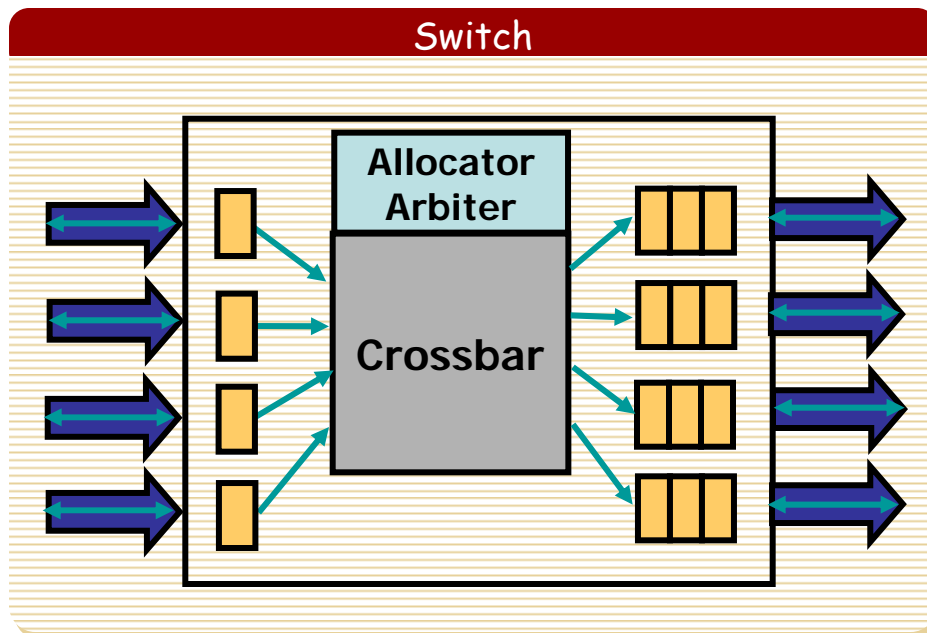

Introduction
 Xpipes Lite Architecture
 Design Flow
 Experimental Results

Lite Version
 NI Architecture
 Packetization
 Switch Architecture

Xpipes Lite: Switch

- Output Queued
- Buffering for Performance
- ACK/nACK Flow & Error Control
- Support for Asymmetric Topologies
- Designed for Pipelined, Unreliable Links

- ACK/nACK Flow & Error Control
- 2-stage pipelined
- High Speed (1GHz @ 130nm)
- Wormhole Switching
- Arbitration: Fixed / RR
- Source Based Routing

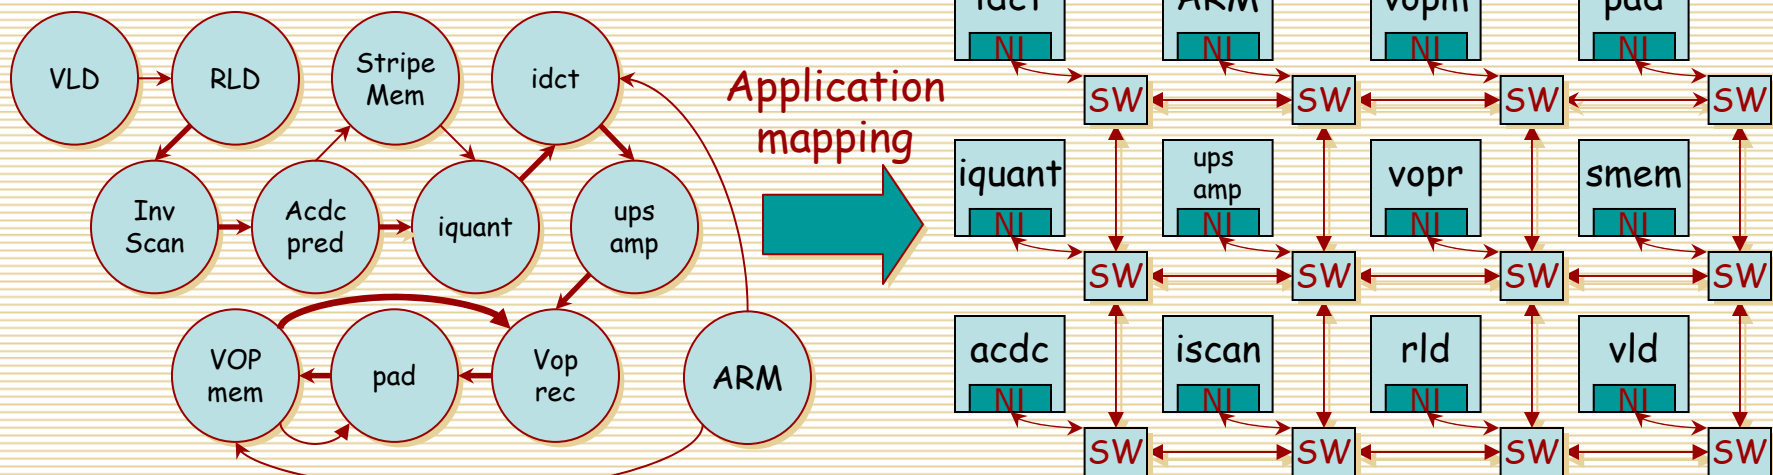

High Level View

Typical SoC Application Characteristics

- Complex
- Highly Heterogeneous
- Communication Intensive

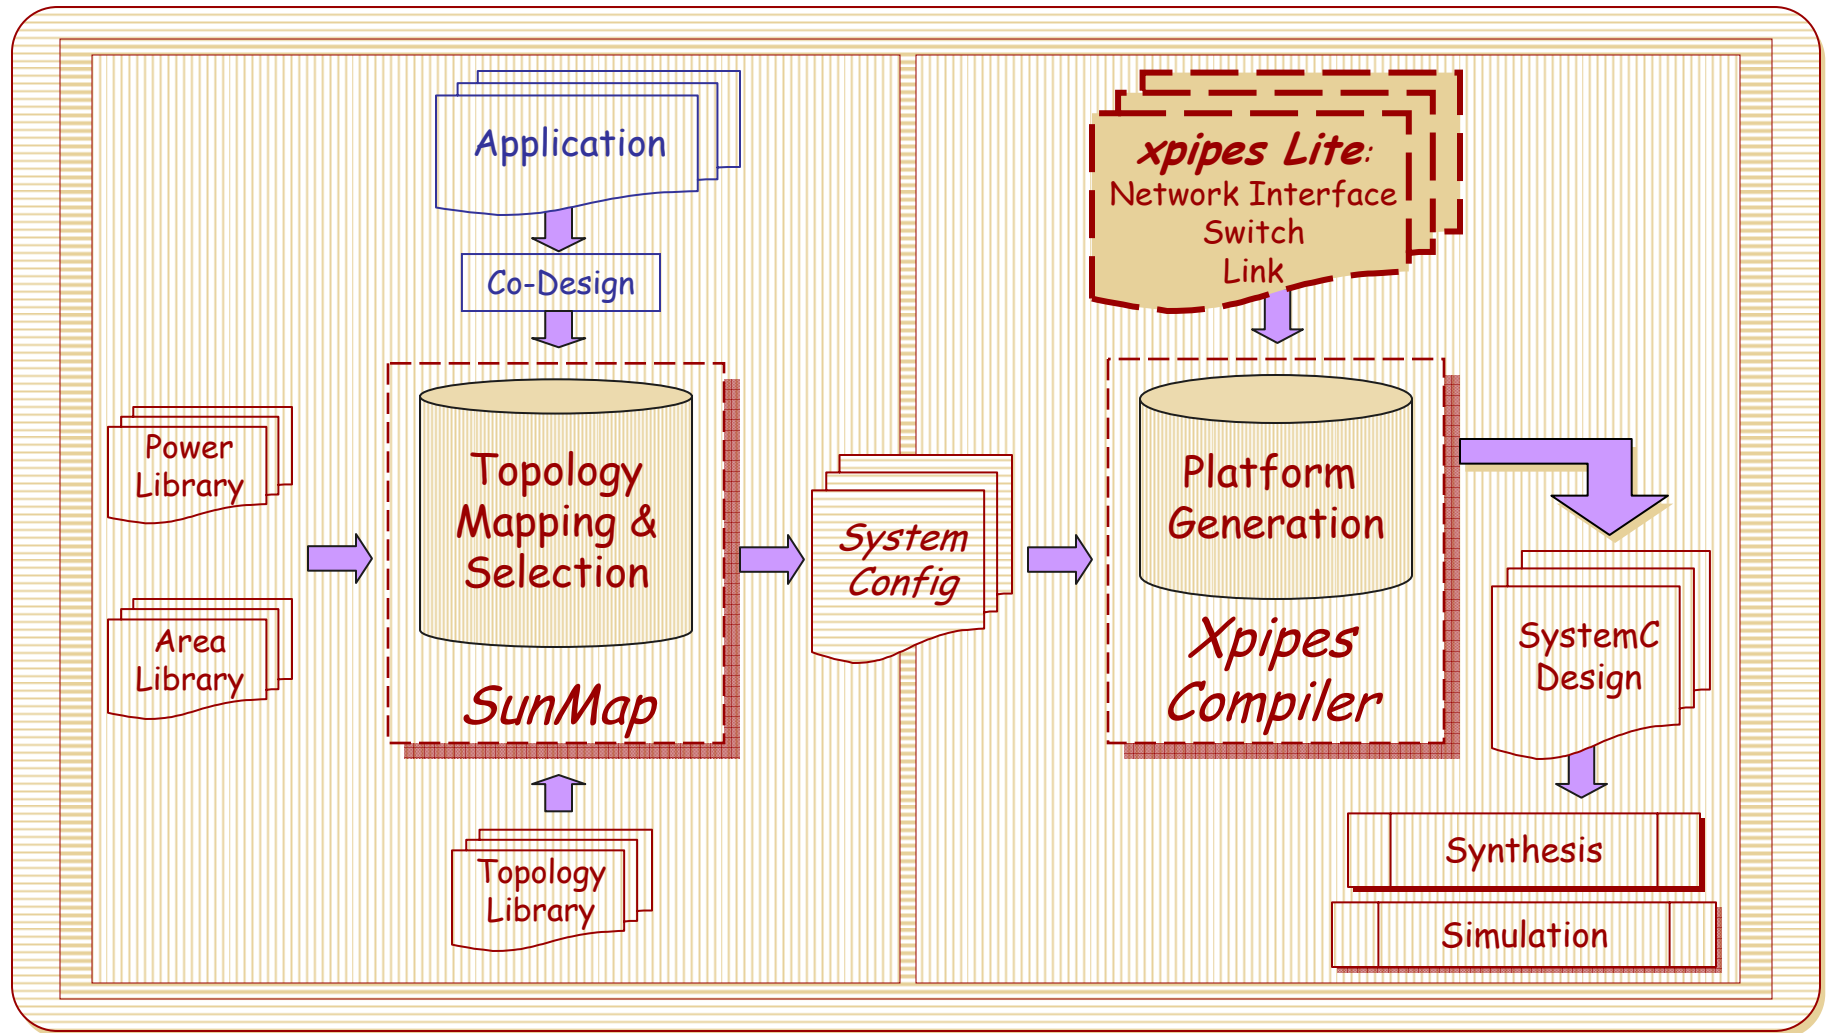

• xpipes: Synthesizable, High Performance, Heterogeneous NoC Infrastructure

Example

NetChip NoC Synthesis Flow

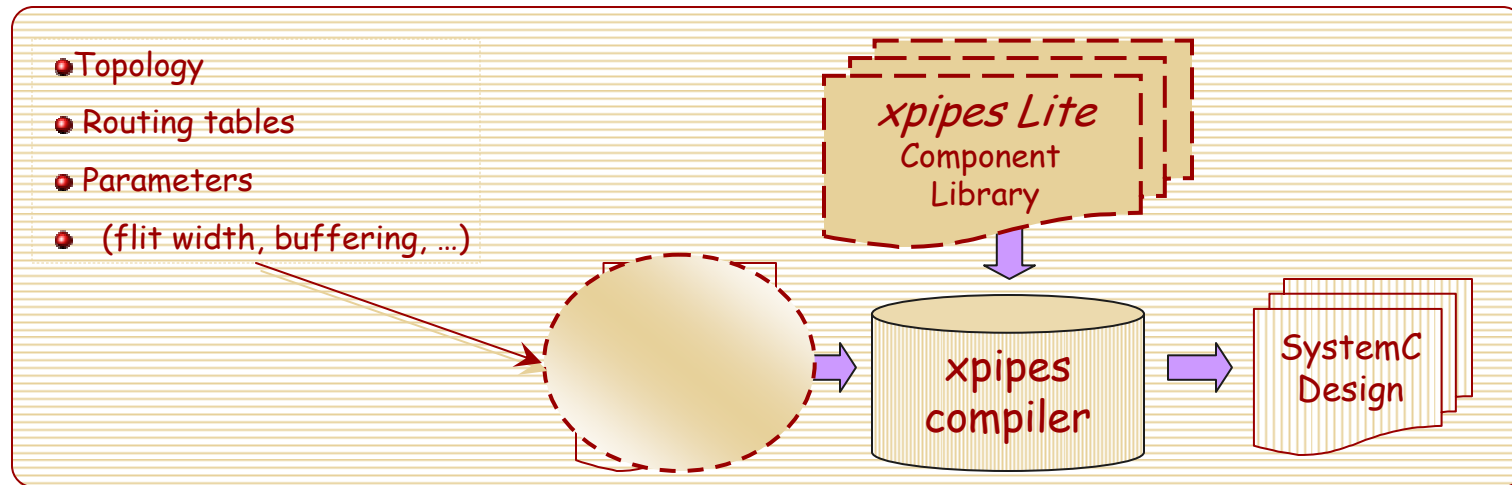

Topology Instantiation

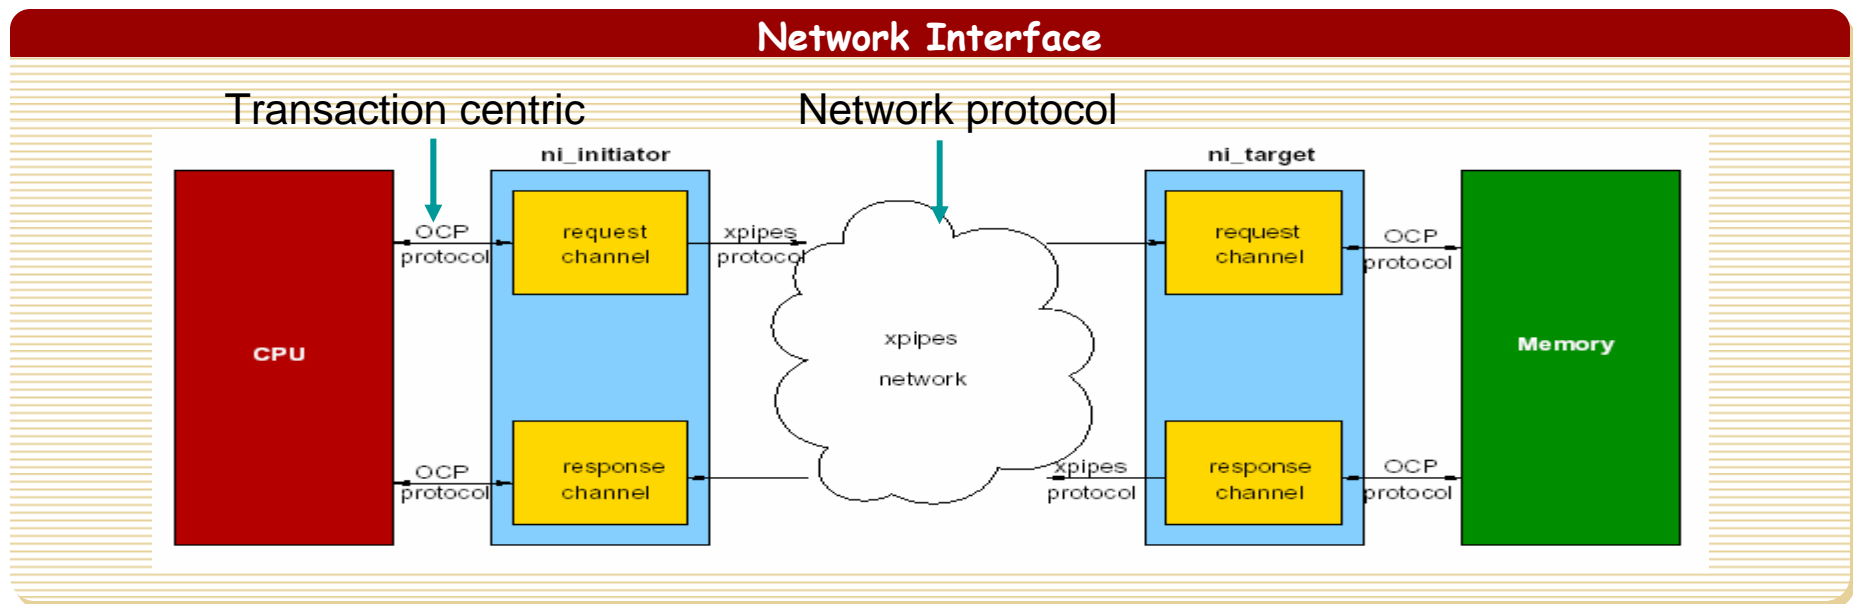

xpipes Compiler

- Creates a Class Template For Each Network Component Type
- Component Optimizations
 - I/O Ports
 - Buffer Sizes
- Hierarchical System Instantiation
 - Synthesis View
 - Simulation View

Xpipes Lite: Network Interface

NI Synthesis Results

Area (mm ²)			
Flit Width	Output Buffer Stages		
	4	16	64
Initiator NIs			
16	0.025	0.037	0.093
32	0.036	0.061	0.179
64	0.051	0.111	0.361
128	0.092	0.186	0.724
Target NIs			
16	0.035	0.053	0.110
32	0.045	0.078	0.193
64	0.063	0.114	0.352
128	0.117	0.230	0.701

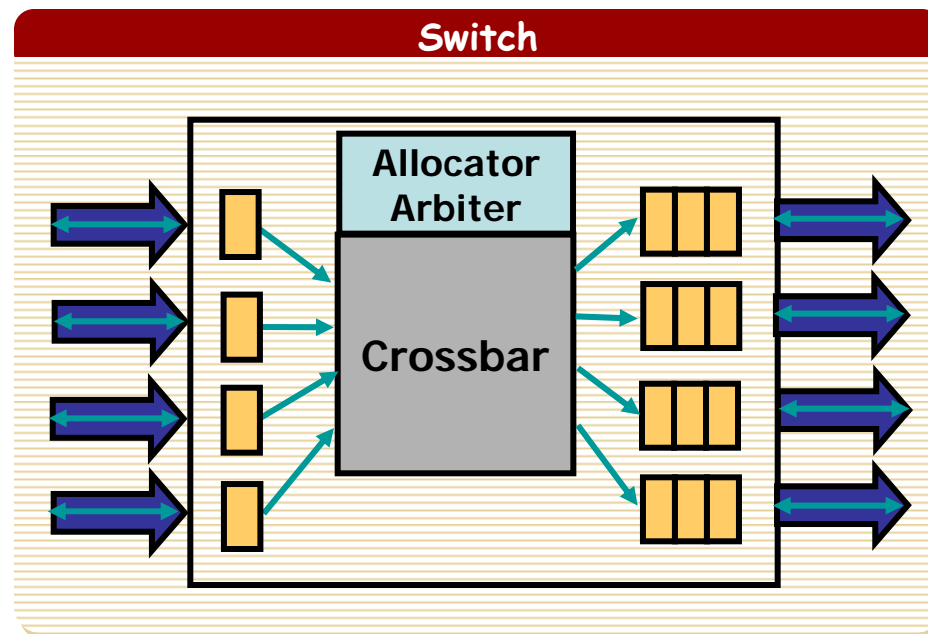

NI Synthesis Results

Power (mW)			
Flit Width	Output Buffer Stages		
	4	16	64
Initiator NIs			
16	22.7	30.4	59.6
32	33.5	47.7	104.8
64	49.3	77.1	194.8
128	87.8	144.5	379.3
Target NIs			
16	27.5	34.8	62.6
32	36.9	51.1	106.9
64	55.4	82.0	194.3
128	93.3	151.1	382.5

Xpipes Lite: Switch

Switch Synthesis Results

Area (mm ²)		
Flit Width	Output Buffer Stages	
	4	16
4x4 Switches		
16	0.054 @ 1 GHz	0.126 @ 1 GHz
32	0.091 @ 1 GHz	0.214 @ 1 GHz
64	0.161 @ 1 GHz	0.378 @ 1 GHz
128	0.311 @ 1 GHz	0.777 @ 1 GHz
4x6 Switches		
16	0.091 @ 990 MHz	0.226 @ 950 MHz
32	0.151 @ 970 MHz	0.389 @ 950 MHz
64	0.287 @ 970 MHz	0.777 @ 915 MHz
128	0.518 @ 925 MHz	1.637 @ 900 MHz
6x4 Switches		
16	0.070 @ 980 MHz	0.167 @ 900 MHz
32	0.112 @ 950 MHz	0.268 @ 900 MHz
64	0.213 @ 935 MHz	0.533 @ 890 MHz
128	0.400 @ 875 MHz	1.028 @ 830 MHz

Switch Synthesis Results

Power (mW)

Flit Width	Output Buffer Stages	
	4	16
4x4 Switches		
16	31.1	62.7
32	55.5	116.9
64	104.4	219.3
128	199.1	430.5
4x6 Switches		
16	42.8	90.1
32	79.7	170.8
64	148.2	334.4
128	283.2	617.3
6x4 Switches		
16	35.9	69.1
32	62.9	123.2
64	117.2	237.6
128	223.4	453.5

Area Breakdown & Mesh Case Study

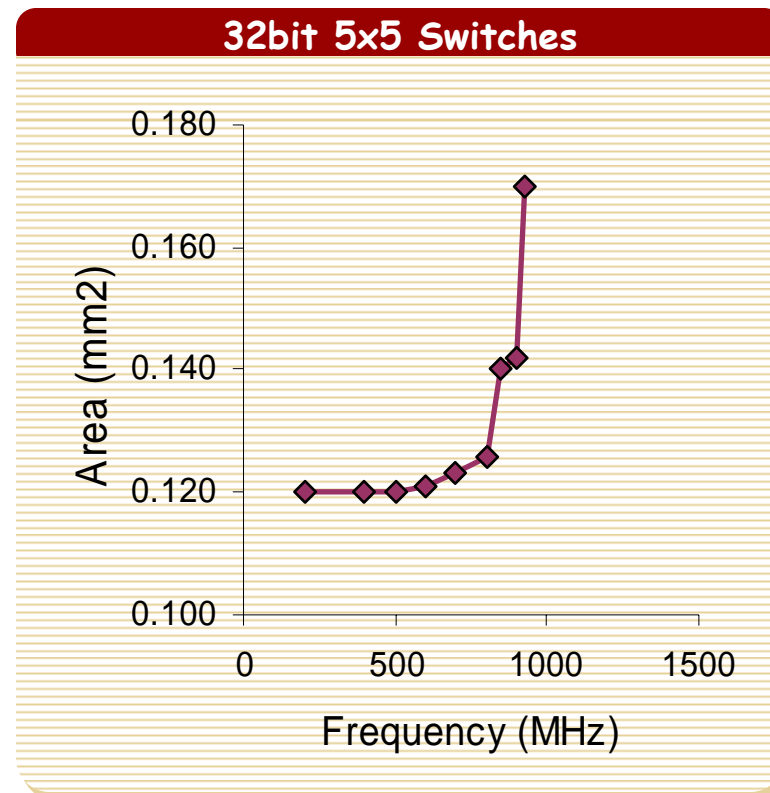

- A 3x4 xpipes mesh for 4 processors and 7 slaves occupies ~2,2 mm²
- Initiator NI / Target NI / 4x4 Switch @ 1GHZ
- 6x4 Switch @ 875 - 980 MHz

Synthesis Tradeoffs for NoC Soft Cores

- Greater Opportunity for Optimization
- Various Power/Frequency/Area Tradeoffs!

The Power of Abstraction: *Shift Efforts at a Higher Abstraction Layer*

Quick and Accurate Estimations

Sample xpipes Topologies

Fewer Clock Cycles (*Latency Gains*)
 However: 780MHz, .48mm² area

925MHz, .51mm² (+10% Performance!)
 OR: 850MHz, .42mm² (-14% Area)

Conclusion

- Complete Synthesis Oriented Design Flow for NoCs
 - Automatic NoC Generation from Application Graph
 - Parallel Synthesis & Simulation Design Flows
- High Speed, Highly Parameterizable Design Library
 - Allows Faster & More Accurate Design Space Exploration

DEMO

Thank You!
